# MT6771 AWB Color Case Study

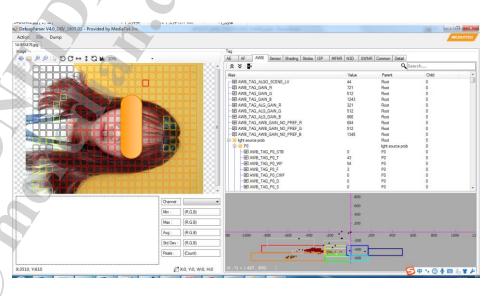

# Face Assist 相关参数Tuning方法

original

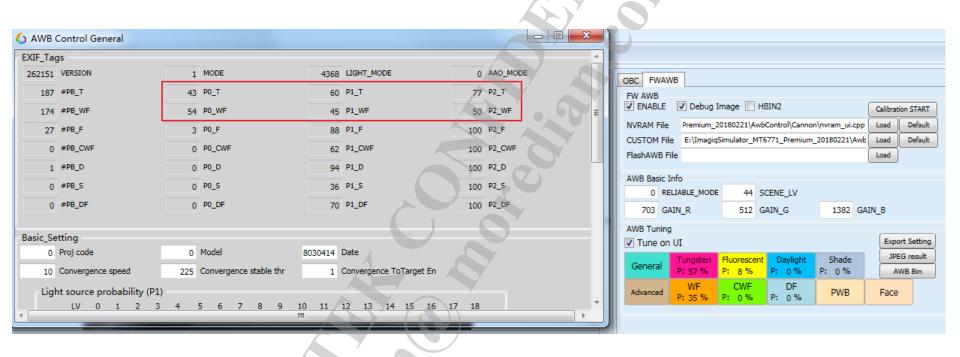

target

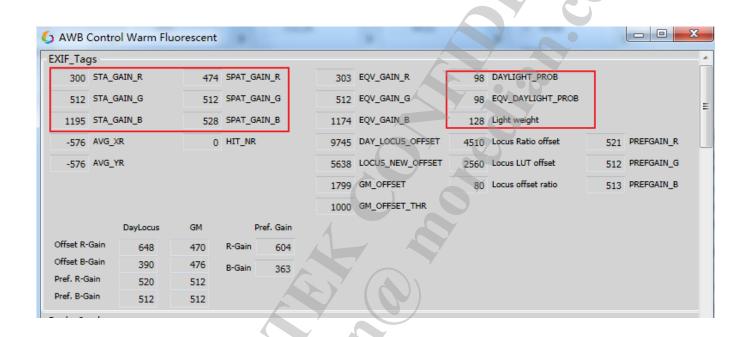

分析:从EXIF信息中看落点信息,橙色完全落入WF,人脸区域主要落入Tungsten。如果把橙色收白最终效果就好比较紫红,目前的图片看起来有点蓝紫,因此可以先降低WF光比例,打开face assistant计算face reference gain是否有加R减B的趋势。

1、在Tuning on UI 界面导入拍照时的参数,从模拟EXIF结果看,2个色温的P2都有降低,可再继续降低WF光的P2。

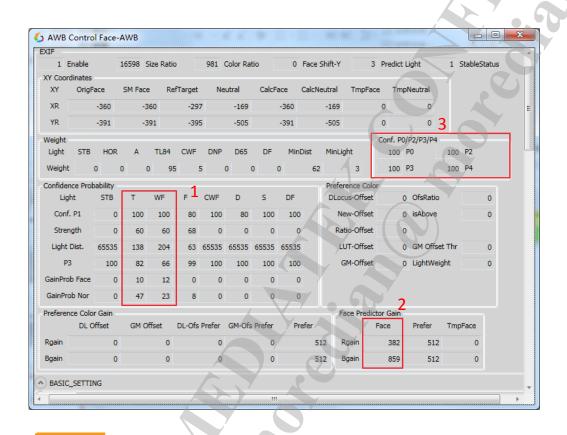

2、WF 光statistics gain比较蓝,可以通过多混spatial gain来降低,但是会导致同LV下的落入WF光的低色温太黄,对比T和WF的EQV Gain,T光的要正常一些,因位橙色很大概率是混淆色,因此首先考虑降低WF的P2来降低WF比例。

### 3、face assistant EXIF 信息查看

AWB Tuning on UI 界面可查看Face assistant 模拟的结果,可先看confidence probability的 GainProb Face,如果为0,表示face assistant对这个色温没有作用,如果有作用再查看face predictor gain,可以用这个gain与各色温的EQV GAIN\*preference gain做对比,看多混face predictor gain是否会对效果有改善,如果没改善并且作用是相反的,可以调整face assistant 相关参数降低混合比例,最常调的是根据LV调各色温的P1来降低混合比例。

Advance	P: 35 %	P: 0 %	P: 0 %	FWD	l ace								

### Face assist on

### 4、face assistant 常调参数

- 1、如果是单一场景问题,有些根据LV和色温来调整P1和P2,但是P2不太容易打到,所以常调的还是P1。
- 2、如果想整体加大face assistant 强度,可直接调整3的comp ratio,前期要先确定好
- 3、Distance的Thr Low和High调整可影响最终P3的结果,需前期确定好范围。
- 4、Prob3和Prob4在拍前摄正常 大小人脸时,调整的参数应让最 终稳定后的P3和P4能达到100

5、通过调整WF的P2和打开face assistant模拟,最终结果如下图中间效果,较之前有很大改善。 Face assist和P2的作用主要是用来降低混淆色比例,因此遇到混淆色优先考虑这2个feature。

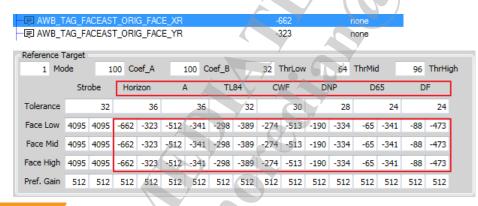

### **Face assist calibration**

Face assist reference target Calibration 方法:

1、用AWB golden去灯箱拍各个色温下的人像卡jpg。

2、将EXIF信息中ORIG\_FACE\_XR/YR值填入参数档,如下图红框部分。各色温的 Low/mid/high分别对应不同亮度的target,可对应不同肤色的target,默认我们可以设一样的。

# Face Comp 相关参数Tuning方法

分析:从落点和EXIF信息看,这个景基本都是Tungsten 光源,比target偏红,可以调整低色温相关的参数来改善,如果低色温相关参数调整与其他景冲突,可以考虑face comp是否有机会调整。

### face comp 相关EXIF分析:

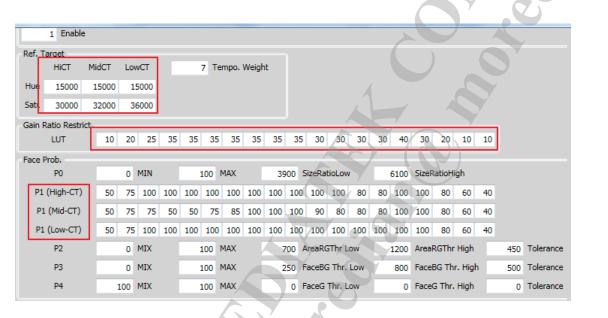

- 1、查看OrigTarget 与Target gain的差异,如果2个gain一致表示face comp对这个景没有作用。如果没有作用,可以先查看2和3部分的条件是否满足
- 2、2和3的exif信息表示当前Hue和saturation与参数设置的target Hue和sat,如果Hue或者Sat的current与target差异超过Tolerance,才会用face comp来补偿normal awb 的结果。因此要让一个景face comp有作用,首先调整参数满足Hue或者Sat的条件

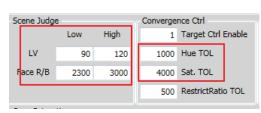

3、如果满足face comp的作用条件,则可以调整作用强度。从调试经验看,一般face comp作用的景都是SAT满足条件,作用的方向主要就是加饱和度和降饱和度,这个景的current SAT为42775,大于target,则会apply一组reduceSat 的gain,reduce的趋势是减R加B,加B的最大强度是3.5%,R做适当的计算。

### Face comp主要调整参数:

- 1、ref target,可调整低中高色调的target Hue和saturation,搭配TOL一起调整。这部分参数前期先大致调整到一个范围,后期做大的改动影响范围较大;
- 2、根据LV调整gain ratio,如果部分LV需要加大或者降低face comp的强度,可调整gain ratio;
- 3、同一个LV下,不同色温下可能需要apply不同强度的face comp,可根据P1来分别调整。当 scene Judge参数为0,则P1的低中高色温由normal AWB的色温确定权重。如果scene judge有值,则计算face的R/B并用scene Judge参数来判断色温,ref target的低中高色温区分方法同P1。
- 4、P2和P3不常调,除非有极端景才需要做相应调整。P2主要低色温能打到,P3主要是中高色温能打到

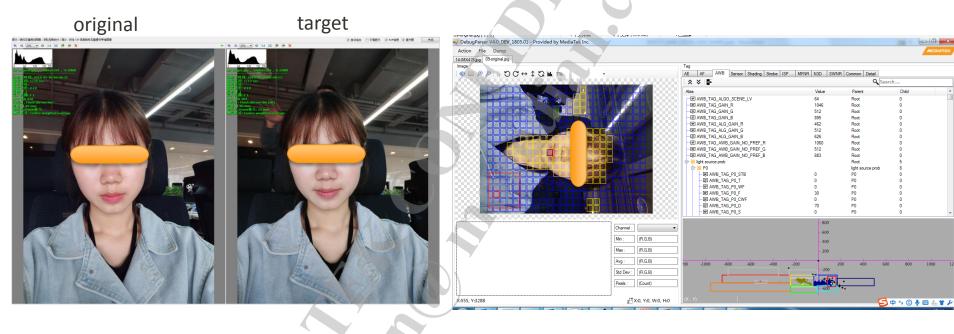

5、face comp可以用来改善人脸饱和度非常低或非常高时的效果,可在不影响正常饱和度场景下,将饱和度差异大的景补偿到一定范围,face comp可作为针对特殊景做差异化调整。

### Extra Color 相关参数Tuning方法

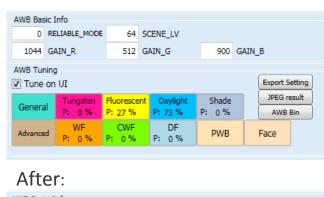

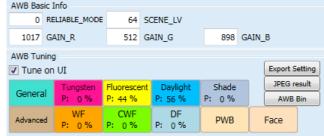

分析:与对比机相比有点偏红,从EXIF信息中看落点信息,主要是牛仔色衣服落入Daylight 并靠近右边,如红色框位置,这样就会导致最新daylight 平均落点会在真实光源的基础上右移,导致计算的统计gain会偏红。Daylight可调整的参数比较少,衣服是混淆色,不建议直接调整preference gain或混spatial gain比例,落点比较靠下,也没办法调整limit Y来改善。这种景基本只能通过调整光源比例来改善,MT6771有多开出8个extra color框,可以改变光源的P2和daylight locus prob,因此这个景可以尝试用extra color 来做特殊调整。

1、用DP看衣服落点位置,用Light area把衣服的落点框进来,然后再模拟输出process raw,量测衣服区域的G value,设置G-Level范围卡落入extra color的落点,如果只是针对这个景,还需要用LV来卡范围,以免影响其他景,模拟可以从exif信息看到满足落点的count和各mode的weight。Mode0为混入extra color的spatial gain,Mode1位降低P2,mode2为降低daylight locus prob。此场景可以通过降低daylight的P2来改善,因此light source select选daylight,mode1的weight设最大256,最终模拟可以让Daylight的P2降低50%。

	Statistic	Smooth Stat	Panel	Extra-0	Extra-1	Extra-2 Extra	<ul> <li>3 Extra-4</li> </ul>	Feetra-5	Extra-6	Extra-7

#### Before:

2、最终效果有改善,MT6771在之前平台基础上,增加了更多的调试弹性。能更好的解决特殊景的一些问题,但用extra color调试时需多考虑不同场景是不是会有冲突,如果是单个景问题,可将条件设置严一些,这样影响范围比较小。

### Color engine default value reset 导致闪烁

项目调试过程中有用color engine中的Y engine 模块加大face 区域的亮度,给参数过程中部分 index的default value不小心被reset掉,导致概率性出现闪烁的问题,下面蓝框的值为被reset 的值。

### Default value:

```
COLOR_TBL = {
.cfg_main = {.bits = {.COLOR_C2P_BYPASS=0, .COLOR_P2C_BYPASS=0, .COLOR_YENG_BYPASS=0, .COLOR_SENG_BYPASS=0, .COLOR_HENG_BYPASS=0, .rsv_5=0, .COLOR_ALL_BYPASS=0.
.c_boost_main={.bits = {.COLOR_C_BOOST_GAIN=128, .rsv_8=0, .COLOR_C_NEW_BOOST_EN=0, .rsv_14=0, .COLOR_C_NEW_BOOST_LMT_L=64, .COLOR_C_NEW_BOOST_LMT_U=255}},
.c_boost_main_2={.bits = {.COLOR_COLOR_CBOOST_YOFFSET=0, .rsv_8=0, .COLOR_COLOR_CBOOST_YOFFSET_SEL=0, .rsv_18=0, .COLOR_COLOR_CBOOST_YCONST=128}},
.luma_adj = {.bits = {.COLOR_Y_LEVEL_ADJ=64, .rsv_7=0, .COLOR_Y_SLOPE_LMT=255, .rsv_16=0}},
.g_pic_adj_main_1={.bits = {.COLOR_G_CONTRAST=128, .rsv_10=0, .COLOR_G_BRIGHTNESS=1024, .rsv_27=0}},
```

### 被 reset value

```
.COLOR_TBL = {
.cfg_main = {.bits = {.COLOR_C2P_BYPASS=0, .COLOR_P2C_BYPASS=0, .COLOR_YENG_BYPASS=0, .COLOR_SENG_BYPASS=0, .COLOR_HENG_BYPASS=0, .rsv_5=0, .COLOR_ALL_BYPASS=0, .c_boost_main={.bits = {.COLOR_C_BOOST_GAIN_=0, .rsv_8=0, .COLOR_C_NEW_BOOST_EN=0, .rsv_14=0, .COLOR_C_NEW_BOOST_LMT_U=0}, .coLor_C_NEW_BOOST_LMT_U=0}, .coLor_C_NEW_BOOST_LMT_U=0}, .coLor_C_NEW_BOOST_LMT_U=0}, .luma_adj = {.bits = {.COLOR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR_C_LOCAR
```

# Color engine default value reset 导致闪烁

- Color调试请注意以下事项:
- 1、各index COLOR\_TBL (如前几行), control bit 若无特殊需求,尽可能维持 default value, or 各 index align
- 2、因为这些control bit不会被内差 → 若相邻 index, control bit 开关有差异,会造成不预期的跳变
- 3、以memory color 为例子,同一组 memory color,全部最好都定位为同一用途, control bit要开就全部index一起开, input range 也设为一样的window,效果控制可靠output offset控制,不想有作用就設定为 0 (slope = 128)
- 4、提交参数前,需要compare diff code,看是否都是预期內的修改(因为参数有可能被tool 改掉一些 control bit 设定)

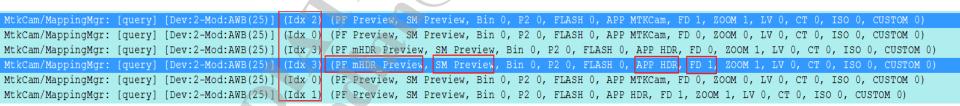

# AWB Log分析

#### 1, adb cmd:

adb shell setprop debug.mapping\_mgr.enable 1 adb shell setprop debug.awb\_log.enable 1 adb shell setprop debug.awb\_mgr.enable 1 adb shell setprop debug.awb.enable 1

2、通过log确认不同模式切换时AWB参数index是否正确。如下ldx后的数字为AWB NVRAM对应的index。Index主要由Profile,sensor mode,APP和face来确定,不同组合跑哪个index有参数档中的MT6771\_NVRAM\_IF\_xxx.xlsx确定。

PF: profile SM: sensor mode FD: face detect

3、OTP Gain: pregain1 GainSetNum为3,表示有读到3组OTP gain,并且enable了三色温 OTP功能。

```
三色温OTP enable
D awb algo: [2] AWB Mode = 1
D awb algo: [2] Stat Config W = 1296 H = 1940

D awb_algo: [FaceAWB] AvgFaceXrYr: -6645, -6528, ColorRatio: 935
```

5、Face Assist相关log,打印计算出的P和faceGain。

FaceGain Prev:前一帧 face gain, curr:当前face gain, Target: smooth 之后的face gain.
FaceXY 表示face平均落点的XY,如果出现face assistant异常,可查看face XY是否异常,如果异常可能是face框统计值问题,neutralXY表示根据faceXY 估计当前环境色温的XY位置。

```
awb_algo: [FaceAst_Conf] P0(100), P2(100), P3(100), P4(100)

awb_algo: [FaceAst_Conf] STB T WF F CWF D S DF

awb_algo: [FaceAst_Conf] P1 - 0, 93, 100, 80, 100, 80, 100, 100

awb_algo: [FaceAst_Conf] P - 0, 93, 100, 80, 100, 80, 100, 100

awb_algo: [FaceAst_FaceGain] Prev(323, 512, 967), Curr(326, 512, 954), FaceGain(325, 512, 965)

awb_algo: [FaceAst_EnqChk] i4StableStatus,1, bRet,1

awb_algo: [FaceAst_Enq] TmpBufNum(8), LV(73), XY(-455, -414), ToL(34)

awb_algo: [FaceAst_Record] Case-1: Stable or EnqBufferNotEnough

awb_algo: [FaceAst_Record] [TempoInfo] FaceXY(-455, -414), NeutralXY(-266, -478), FaceGain(325, 512, 965)
```

6、打印Normal AWB各色温的统计值,PB: parent Block, WPB: weight parent Block。RGB sum表示该色温下所有落点的统计值累加,XrYr表示RGB转换到XrYr domain的坐标值,每帧各色温的P0,P1,P2和最终的P

awb_algo:	Ь1	PB :	248	WPB	31	7346	RGB	Sum	ι 1	225412	8 1	4732	2219	53	39723	3 1	Avg	39	46	17	XrYr	-332	-415
